Welcome to DGCL Actes IA's documentation!

Document Pipeline

code.utils module

utils.py

Module to manage PDF files

`code.utils.get_file_paths` (path, recursive=False, extension='.pdf')

Returns paths for all the files contained in the folder

Parameters:

- **path** – Path to the folder
- **recursive** – if True, will look for pdf files in directory and subdirectories
- **extension** – Extension that files need to have

Returns: A list with the paths to all files with a specific extension in the folder

`code.utils.get_folder` (path)

Get the folder where the file is

Parameters: **path** – Path to the file

Returns: Folder name where the file is

`code.utils.multiprocessing` (arr, func, workers=-1)

Applies function to array with multiprocessing

Parameters:

- **arr** – List or np.ndarray
- **func** – Function applied to the array
- **workers** – Number of processes in the pool, by default uses the maximum number of cores - 1

Returns: List with the function applied to each element of the input list

`code.utils.multithreading` (arr, func, workers=4)

Applies function to array with multithreading

Parameters:

- **arr** – List or np.ndarray
- **func** – Function applied to the array
- **workers** – Number of threads in the pool

Returns: List with the function applied to each element of the input list

`code.utils.remove_extension` (path)

Removes the extension of the file

Parameters: **path** – Path to the file

Returns: Path without the extension

`code.utils.unzip` (input_path, output_path=None)

Unzip a compressed folder

Parameters:

- **input_path** – Path to the compressed folder
- **output_path** – Path where to uncompress the folder (default will uncompress in the same folder with the same name as the compressed file)

Returns: True if the folder was unzipped successfully, False otherwise

code.extract module

extract.py

Module to extract text from PDF files

`code.extract.text_from_pdf` (path, ignore_image=False)
Extracts text from a pdf

Parameters:

- **path** – Path to the pdf file
- **ignore_image** – If True, ignore pdf with images for faster processing

Returns: A String corresponding to the text in the PDF

`code.extract.text_from_pdf_image` (path)
Extracts text from a pdf image

Parameters: **path** – Path to the pdf image file

Returns: A String corresponding to the text in the PDF

`code.extract.text_from_pdf_text` (path)
Extracts text from a pdf text

Parameters: **path** – Path to the pdf text file

Returns: A String corresponding to the text in the PDF

code.pipeline module

`class code.pipeline.Pipeline`

code.bdd module

bdd.py

Module to manage PostgreSQL database

`class code.bdd.PostgreSQL_DB` (enable_mail=True)

`drop_table` (table_name)
Drop a table from the database

Parameters: **table_name** – Name of the table to drop

Returns: True if the table was successfully dropped, False otherwise

`get_table` (sql_query)
Query the database and store it in a dataframe

Parameters: **sql_query** – Query in the database

Returns: Dataframe containing the result of the query

`save_table` (df, table_name, if_exists='replace')
Save table to postgresSQL database

Parameters:

- **df** – Dataframe to save
- **table_name** – Name for the table in the database
- **if_exists** – 'replace' to replace the table or 'append' to append to the existing table

Returns: True if the table was saved successfully, False otherwise

`send_error_data_by_mail (error_traceback)`

Display the last error traceback and send alert email.

Parameters:

- **email_infos** – a dictionary like `{'sender':sender@domain.com, 'receivers':['receive1@domain.com', 'receive2@domain.com'], 'server':'mail.part.net'}`
- **error_traceback** – error traceback text

Indices and tables

- `genindex`
- `modindex`
- `search`
